

Salesforce CRM Project Documentation

WhatNext Vision Motors

Shaping the Future of Mobility with Innovation and Excellence

Prepared on a Salesforce Developer Edition Org

Name: KRITISRI SAMPATH KUMAR
College : R.M.K Engineering College

1. Project Overview

WhatNext Vision Motors is a purpose-built Salesforce CRM implementation created to support the day-to-day operations of an automotive business. Rather than relying on scattered spreadsheets or disconnected tools, the application brings vehicle, customer, dealer, order, test-drive, and service information into a single Salesforce environment.

A large part of the system revolves around how vehicle orders are placed. Before any order is confirmed, the platform checks that the requested vehicle is actually in stock, and it can automatically assign a suitable dealer to the order based on rules configured within the org, removing the need for manual dealer allocation.

To cut down on repetitive manual work, the solution also relies on Salesforce automation — for example, sending reminders ahead of scheduled test drives and moving pending orders forward once conditions are met. The Lightning Experience interface gives users a clean, organised way to navigate the app, while reports and dashboards give management visibility into ongoing business activity.

2. Objectives

The solution was built around the following five goals:

2.1 Centralize Automotive Information

Bring vehicle, customer, dealer, order, test-drive, and service data together inside one Salesforce environment so information does not have to be tracked across separate, disconnected systems.

2.2 Improve Order Processing

Give staff a structured, repeatable way to create and manage vehicle orders, with vehicle availability checked automatically as part of that process.

2.3 Reduce Manual Activities

Take repetitive, rule-based tasks off users' plates by handling them through Salesforce Flow and Apex wherever it makes sense to do so.

2.4 Maintain Data Accuracy

Apply validation rules and programmatic checks so incomplete or invalid transactions are caught before they are saved, rather than discovered later.

2.5 Simplify User Interaction

Deliver a Lightning application with sensible navigation, well-organised page layouts, and record views that surface the information users actually need.

3. Phase 1 — Requirement Analysis and Planning

This first stage focused on translating a general business scenario into concrete Salesforce requirements. In line with the project guidelines, it covers requirement gathering, project scope, the data model, and the planned security model.

3.1 Business Requirements

Requirements were drawn from the everyday activities of an automotive dealership — from the point a customer shows interest in a vehicle through to post-sale servicing. The system needed to hold information about vehicles and customers while also supporting the actions that happen both before and after a sale.

The core business requirements identified were:

1. Maintain a record of available vehicles.
2. Keep track of customer details.
3. Store information about dealers.
4. Log vehicle orders as they are placed.
5. Link each order to the relevant customer, vehicle, and dealer.

3.2 Project Scope

Vehicle Management: Holds core vehicle details — model, price, stock on hand, and availability status.

Dealer Management: Stores dealership records used to support vehicle sales and dealer-related activity.

Customer Management: Captures customer information needed for sales, test drives, and service interactions.

Order & Test Drive Management: Logs vehicle purchase orders and manages scheduled test drives, linking customers to the vehicles they're interested in.

Service Request Management: Records customer service needs and ties them back to the relevant customer and vehicle.

3.3 Data Model

The data model reflects how the major entities in the automotive CRM process relate to one another. A vehicle can have associated order and test-drive records; customer records connect to both orders and test drives; and dealer records tie into vehicle transactions.

Building these relationships in rather than duplicating data across objects keeps related records easy to find and avoids the inconsistencies that come with storing the same information in more than one place.

The screenshot displays the Salesforce Object Manager interface. At the top, there is a navigation bar with 'Setup', 'Home', and 'Object Manager' (selected). Below this, a breadcrumb trail shows 'SETUP > OBJECT MANAGER'. The main heading is 'Vehicle Order'. On the left, a sidebar lists configuration options: 'Details', 'Fields & Relationships' (highlighted), 'Page Layouts', 'Lightning Record Pages', 'Buttons, Links, and Actions', 'Compact Layouts', 'Field Sets', and 'Object Limits'. The main content area is titled 'Vehicle Order New Relationship' and includes a 'Help for this Page' link. It shows 'Step 2. Choose the related object' with 'Previous', 'Next', and 'Cancel' buttons. A text prompt asks to 'Select the other object to which this object is related.' Below this, a 'Related To' dropdown menu is set to 'Vehicle Customer'. At the bottom of the form, there are again 'Previous', 'Next', and 'Cancel' buttons. A caption at the bottom of the image reads: 'Object Manager showing the six custom objects and their relationships'.

3.4 Security Model

Security was planned alongside the data model rather than added afterward. The org's access control relies on a combination of:

- Profiles
- Roles
- Role hierarchy
- Permission sets
- Object-level permissions

4. Phase 2 — Salesforce Development: Backend & Configuration

The second phase covered building out the Salesforce data structures and the backend logic that sits behind them. As required by the project guidelines, this section documents the objects, fields, validation, automation, and Apex components that make up the backend.

4.1 Setup Environment and Development Workflow

Development took place in Salesforce Lightning Experience. The org was used to define custom objects and fields, set up relationships between them, build automation, write Apex, configure reports, and manage the org's security settings.

4.2 Custom Objects

Six custom objects represent the core business entities in the WhatNext Vision Motors system:

Vehicle: Captures details such as model, price, stock quantity, availability, and the associated dealer.

Dealer: Stores dealership details — name, location, city, and contact information.

Customer: Holds customer information used across purchases, test drives, and service visits.

Vehicle Order: Records a purchase, including the selected vehicle, the customer, the dealer, and the order's current status.

Vehicle Test Drive: Tracks test-drive bookings, including customer, vehicle, appointment date, and status.

Vehicle Service Request: Logs a customer's service need along with the related vehicle, customer, and status.

The screenshot displays the Salesforce Object Manager interface. At the top, there's a navigation bar with 'Developer Edition' and a search bar. Below this, the 'Object Manager' section is active, showing a list of 6 items sorted by label. The list includes:

LABEL	API NAME	TYPE	DESCRIPTION	LAST MODIFIED	DEPLOYED
Vehicle	Vehicle__c	Custom Object		9/2/2026	✓
Vehicle Customer	Vehicle_Customer__c	Custom Object		9/2/2026	✓
Vehicle Dealer	Vehicle_Dealer__c	Custom Object		9/2/2026	✓
Vehicle Order	Vehicle_Order__c	Custom Object		9/2/2026	✓
Vehicle Service Request	Vehicle_Service_Request__c	Custom Object		9/2/2026	✓
Vehicle Test Drive	Vehicle_Test_Drive__c	Custom Object		9/2/2026	✓

At the bottom of the screenshot, there is a caption: *Object Manager list view and a New Custom Object definition screen*.

4.3 Fields

Custom fields were added to each object to capture the specific information that object needed to store — for example, stock quantity and price on Vehicle, or status picklists on Vehicle Order, Vehicle Test Drive, and Vehicle Service Request.

Fields & Relationships list for the Vehicle Order object

4.4 Validation Rule — Vehicle Stock

A validation rule stops an order from being confirmed if the linked vehicle doesn't have enough stock to fulfil it. This protects the ordering process from letting through a transaction that the dealership couldn't actually complete.

As an example, if a vehicle's stock quantity is zero and a user tries to confirm an order against it, the rule fires and the save is blocked with an explanatory error.

VehicleOrderTriggerHandler

4.5 Flow Automation

Salesforce Flow handles a number of processes that would otherwise need to be done by hand. In this project, Flow is used for two main things: assigning a dealer to a new order automatically, and sending reminder emails ahead of upcoming test drives.

4.6 Apex Classes and Triggers

4.6.1 Apex Classes

Vehicle Order Processing: Apex classes hold the business logic tied to how vehicle orders are handled.

Stock Validation: Checks vehicle availability and enforces the stock conditions an order needs to satisfy.

Order Management: Processes and updates order records as their status changes.

Reusable Business Logic: Logic lives in dedicated Apex classes rather than directly in triggers, which keeps it easier to maintain and test.

Automation Support: These classes are called from triggers and other automation so the required checks run consistently wherever an order is created or changed.

4.6.2 Apex Trigger

A trigger on Vehicle Order responds to the relevant DML events and runs the associated business checks. Its main responsibilities are:

- Checking stock availability before an order is saved.
- Blocking invalid order processing.
- Updating vehicle stock once a transaction is confirmed.
- Supporting order-status transitions.

To keep things maintainable, the trigger itself stays thin — it simply calls into the handler class, which is where the actual business logic lives.

5. Phase 3 — UI/UX Development and Customization

The third phase was about building a usable front end in Salesforce Lightning. As called for in the guidelines, this covers the Lightning App and App Manager, page layouts, Dynamic Forms, user setup, reports and dashboards, Lightning Record Pages, and any Lightning Web Components used.

5.1 Lightning App (via App Manager)

A single Lightning App, WhatNext Vision Motors, brings together the Vehicles, Dealers, Customers, Orders, Test Drives, and Service Requests tabs in one place. This gives users one entry point to reach every record type the business needs, instead of navigating between separate areas of the org.

5.2 Page Layouts and Dynamic Forms

Page layouts were arranged so that each record shows the fields and related lists that matter most for that object, without cluttering the page with information users rarely need.

Dynamic Forms were used where a field's relevance depends on the record's current values — rather than showing every field all the time, fields appear only when the conditions around them call for it.

5.3 User Management

Users in the org were set up according to the level of access each role actually requires, so that people can do their jobs without being granted more visibility than necessary.

The screenshot shows a mobile application interface for creating a new vehicle customer record. The form is titled "New Vehicle Customer" and features a close button (X) in the top right corner. A legend indicates that an asterisk (*) denotes required information. The form is divided into two main sections: "Information" and "Owner".

The "Information" section contains the following fields:

- * Vehicle Customer Name**: A text input field containing "Kriti sam".
- Vehicle Customer Email**: A text input field containing "230750.cd@rmkec.ac.in".
- Vehicle Customer Phone**: A text input field containing "6369138236".
- Vehicle Customer Address**: A text input field containing "5/1, Bharathi Stre".
- Preferred Vehicle Type**: A dropdown menu with "Sedan" selected.

The "Owner" section shows a user profile icon and the name "Kritisri Sampath Kumar".

At the bottom of the form, there are three buttons: "Cancel", "Save & New", and "Save".

Creating a new Vehicle Customer record through the app UI

5.4 Reports and Dashboards

Reports give structured, filterable views over the records stored in the org. Dashboards then turn selected reports into visual summaries, so managers can get a quick read on business activity without opening individual records one by one.

5.5 Lightning Record Pages

Record pages were configured so each individual record — a vehicle, an order, a customer, and so on — presents its details clearly. Typical components on these pages include:

- Record detail fields
- The highlights panel
- Related lists (e.g. Vehicle Orders and Vehicle Test Drives shown on a Vehicle record)

6. Phase 4 — Data Migration, Testing & Security

This phase covered loading data into the CRM, confirming that everything built so far behaves as expected, and locking down security. Per the guidelines, it documents data loading, history tracking, duplicate/matching rules, profiles, roles, permission sets, sharing rules, and testing.

6.1 Data Loading

Sample data was prepared in a structured form before being brought into Salesforce. The process followed was:

6. Prepare sample records.
7. Map source fields to the corresponding Salesforce fields.
8. Load the records into the org.
9. Confirm the records were created correctly.
10. Check that relationships between related records came through as expected.

Depending on the object and the volume of records involved, either the Salesforce Data Import Wizard or Data Loader can be used for this step.

6.2 Profiles

Profiles set the baseline permission level for each user — what apps, objects, fields, and other Salesforce functionality they can access.

6.3 Roles and Role Hierarchy

The role hierarchy models the organisation's reporting structure and is used when deciding record-level access. A representative structure for this project looks like:

CEO → Sales Manager → Sales Representative

The hierarchy actually configured in the org should be reflected in the accompanying screenshot rather than this example.

6.5 Sharing Rules

Sharing settings control which users can see which records. The sharing model here was set up to match how the organisation actually works — giving people the access their role requires while keeping records they don't need out of view.

6.6 Test Cases

Test cases were prepared for each major Salesforce feature built in this project — record creation, validation rules, Flow automation, and Apex triggers — with supporting input and output screenshots.

Test Case 1 — Vehicle Creation

Objective: Confirm that a valid vehicle record can be created and saved successfully.

Test Data:

- Vehicle Name: Swift
- Model: SUV
- Stock Quantity: 98
- Price: ₹2,50,000
- Status: Available
- Dealer: Dealer 1

Test Case 3 — Test Drive Reminder Email

Objective: Confirm that the automated reminder process fires correctly ahead of a scheduled test drive.

Test Data:

- Customer: An existing customer record
- Customer Email: A valid email address
- Status: Scheduled
- Test Drive Date: The following day

Test Case 4 — Pending Order Batch Processing

Objective: Confirm that a pending order is processed correctly once the associated vehicle's stock becomes available again.

7. Phase 5 — Deployment, Documentation & Maintenance

The final phase covers how the built components move into their target environment, how the application is kept running smoothly afterward, and how issues get resolved when they come up. As required, this section documents the deployment strategy, maintenance approach, monitoring practices, and troubleshooting process.

7.1 Deployment Strategy

Salesforce metadata moves between environments using the platform's standard deployment tools. For this project, the components that make up a deployment include:

- Custom objects
- Custom fields
- Object relationships
- Validation rules
- Flows
- Apex classes
- Apex triggers
- Lightning pages
- Reports

7.2 Maintenance and Monitoring

A handful of built-in Salesforce tools make it possible to keep an eye on the application and catch problems early:

Apex Jobs: Used to track scheduled and batch Apex as it runs.

Debug Logs: The go-to source when Apex or another Salesforce process behaves unexpectedly.

Flow Errors: Surface failures in automated Flow runs so they can be investigated.

User Access Reviews: Periodic checks to confirm users still have — and only have — the access their role requires.

7.3 Troubleshooting Approach

When something doesn't behave as expected, the following sequence is followed:

11. Identify the Problem — pin down which feature is producing the unexpected result.
12. Reproduce the Issue — repeat the same steps using controlled test data.
13. Review Configuration — check the relevant object, fields, validation rules, Flow, permissions, or Apex logic.
14. Check Logs — for anything automated or programmatic, review the available debug information.
15. Correct the Issue — update whichever configuration or code is responsible.
16. Retest — rerun the original scenario and confirm the expected result now occurs.
17. Deploy the Correction — once testing passes, move the fix to the required environment through the standard deployment process.

8. Conclusion

The WhatNext Vision Motors project delivered a Salesforce CRM environment able to bring together the core activities of an automotive business on a single platform. It shows how Salesforce's declarative and programmatic tools can be combined to model a business's specific entities and processes rather than forcing the business to adapt to a generic template.

Key outcomes of the project include:

- Vehicle, customer, dealer, order, and service data organised through purpose-built Salesforce objects.
- Relationships that connect customers, vehicles, dealers, and orders to one another.
- Automatic stock checks built into the order process.
- Automated dealer assignment for new orders.
- Automated test-drive reminder emails.
- Background processing support for pending orders where implemented.
- A Lightning-based interface that gives users a clear, structured experience.
- Security controls that keep record access aligned with each user's role.
- Reports and dashboards that support ongoing business monitoring.
- Documented test cases that demonstrate the implemented functionality works as intended.

Beyond the finished application, the project also served as hands-on practice in combining Salesforce's declarative configuration tools with custom Apex development.
